Profile Geant4 to identify potential targets (first half of GSoC period)

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ ● ● ●

 Reorder code execution for improving serial performance (2nd half)

In reality Goals are intermingled and alternating

Methods

Ported Geant4 to Solaris 11/amd64

- Instant access to diverse powerful profiling tools, most importantly DTrace
 - "D" stands for Dynamic- dynamically instrument a running program by modifying its instructions while it is running
 - Very sophisticated profiling with minimal overhead (i.e., it allows you to do some pretty crazy stuff)

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

- (Alternatives exist for Linux)
- Tool to compare 2 versions of the same application and generate an HTML report
- Used FullCMS, Simplified Calorimeter and the examples/ as the basis of our tests

Particle "bunching"

Sort particles by their type prior to processing them

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

- e.g.: ..., e^- , e^- , ..., e^- , γ , γ , ..., γ , ...
- Better cache utilisation
- 4-5% speed up in total execution time

In terms of **absolute** numbers, the benefit may not seem breathtaking

Real gain Designed, validated, and automated some very advanced profiling methods that will help us attack performance issues in Geant4
